DETAILED ACTION

Response to Amendment

1. The amendment filed on February 1, 2008 was received and considered by the examiner.

Response to Arguments

2. Applicant's arguments, filed February 1, 2008, with respect to claim 1-17 have been fully considered and are persuasive. The rejection of claim 1-17 has been withdrawn. The applicant's argument that replacing the separation process of Verbraak with the membrane separation process of Grierson would not have been obvious because the separation processes are used to separate different components in different gas scrubbing process (Grierson separation process is used in scrubbing gas containing H_2S whilst Verbraak is used in scrubbing gas containing NO_x) was found persuasive.

Allowable Subject Matter

3. Claims 1-17 are allowed.
4. The following is a statement of reasons for the indication of allowable subject matter:

Regarding claims 1-17, these claims are indicated allowable because the method for removing nitrogen oxide gas comprising the membrane separation process wherein membrane separation process comprising the following steps: (a) filtering at least a portion of the scrub liquid using a first membrane capable of permeating the metal ion

chelate to provide a first retentate liquid comprising the biomass and other solidified components, and a first permeate liquid comprising at least part of the metal ion chelate and dissolved components, and

(b) nanofiltering the first permeate liquid to give a second retentate liquid comprising the metal ion chelate and a second permeate liquid comprising dissolved components, and

(c) recycling at least part of the second retentate liquid to the scrubber , could not be found in the prior alone or in combination.

The closest prior art references to the applicant's invention are Verbraak (WO00/02646) and Buisman et al (US 5,891,408)

Verbraak discloses a method for removing a nitrogen oxide (NO_x) from a gas by bringing the gas into contact with a scrub liquid in a scrubber (1) for converting the nitrogen oxide into molecular nitrogen (N_2), wherein the scrub liquid is provided with agents (such as EDTA) for removing nitrogen oxide from the gas and biomass used in the form of free cells can be circulated with the scrubbing liquid in the scrubber, after which at least a portion of the scrub liquid is subjected to a membrane separation process for separating at least part of the metal ion chelate, and other solidified components, from dissolved components and recycling the chelate containing portion of the scrub liquid to the scrubber (see Verbraak page 2 line 30 –39 page 3 line 1, lines 7 –16, page 5 lines 33 –39 , page 7 lines 10 –16). However, Verbraak does not disclose the specifics of the separation process as claimed by the applicant.

Buisman et al (US 5,891,408) discloses a method of purifying a gas containing nitrogen oxides in which the gas is scrubbed with circulating a scrubbing liquid which

Art Unit: 1797

contains a transition metal chelate such as ion EDTA and biomass (see Buisman abs. col.2 lines 56 – 67).

Therefore, the above prior arts alone or in combination do not teach or suggest the applicant's claimed invention as presented in claim 1.

Any comments considered necessary by applicant must be submitted no later than the payment of the issue fee and, to avoid processing delays, should preferably accompany the issue fee. Such submissions should be clearly labeled "Comments on Statement of Reasons for Allowance."
